## RESEARCH INTERESTS & CURRENT PROJECTS

---

- A systems-level model of the brain and body mechanisms underlying mental life, unifying human affect, emotion, motivation, cognition and action.

- A predictive processing approach to understanding mind and brain, with a focus on the role of metabolic processes, allostasis, and interoception
- The nature and dynamics of affective processing, including the structure of affect, the neurobiology of affect and how it changes with age and disease, individual differences in affective reactivity, and how affect supports memory and perception
- The theory of constructed emotion, including the conceptual system for emotion (including how emotion knowledge is represented and structured in the mind and the brain) and the role of language and conceptual knowledge about emotion in constituting the experience and perception of emotion
- Cultural variation in emotion, with a focus on small-scale, remote societies
- Sex differences in emotion, including the influence of ovarian hormones on brain connectivity, with corresponding changes in memory and experience
- The neuroscience of emotion from an evolutionary-developmental (evo-devo) neuroscience perspective

## DIVERSITY, EQUITY, AND INCLUSION

---

For 30 years, I have mentored young scientists as co-director of the Interdisciplinary Affective Science Laboratory (IASLab). The IASLab is 65–70% female and is diverse ethnically/racially, economically, and in sexual orientation and gender. Across the history of the lab, 14% of its members are from racial or ethnic groups that have been historically underrepresented/excluded in STEM; 17% are from low socioeconomic status backgrounds; 9% are first-generation college students; and 19% indicated other aspects of identity that are historically underrepresented/excluded in STEM. More than half of the peer-reviewed published papers listed in this CV include at least one mentee author from a group that is underrepresented in STEM.
